

ABSTRACT OF THE DISCLOSURE

A presentation apparatus is provided for use with a contact image sensor used for scanning the contents of a document. The presentation apparatus includes a base member adapted to be disposed above the surface of the contact image sensor, a first spring arm extending from the base member and a contact member extending vertically from the first spring arm. The first spring arm urges the contact member into contact with the surface for ensuring flat contact between the document and the surface as the document passes therebetween.
